# Client Proxy 4.3.0 Release Notes

This release includes support for MVISION Private Access on both Windows and macOS.

## What's new in the 4.3.0 release

Client Proxy supports MVISION Private Access. For more information about MVISION Private Access, see the *MVISION Private Access Product Guide*.

If the redirection request is for a Private Application, McAfee Client Proxy performs the following:

- Client Proxy facilitates SAML authentication to ensure that the user is authenticated. When the user is not authenticated, it prompts the user to authenticate.
- Client Proxy identifies traffic based on the list of Private Applications and forwards the request to the nearest McAfee POP through the secure channel.

## Resolved issues in 4.3.0 release

For a list of current known issues, see [McAfee Client Proxy Known Issues \(KB83131\)](#) and there are no issues resolved in this release.
